The Labor Market Information Division (LMID) of the California Employment Development Department responds to a growing demand for customized data products and geographic analysis using the Quarterly Census of Employment and Wages (QCEW). Using Geographic Information Systems, information on the number of establishments, monthly employment, quarterly wages and industry can be summed by geographic area to meet customer needs.

LMID produces an annual analysis of industry data by Los Angeles City Council District, and screens the results for confidentiality. The non-confidential information is provided to the customer for use in decision-making and guiding economic development. This example shows a portion of the data provided to the customer.
